

August 30 2018

**EVENTS (Recap with the professor):**

Explained the issue -> teacher thinks it's too difficult	Need to be able to meet with multiple people to talk about our progress and design
	Cannot make a booking system without collecting some information from Vanier students
	We have an idea to generate test data (random) instead of having user information to determine who booked for development purposes

- VCSA is still an option if our project is refuted

**EVENTS: Team meeting (10am - 11am)**

- Discussed current issue with the contact
- I gave a crash-course on how to use GitHub
- Created different branches in the repository for each team-member's development branch

**EVENTS: Contact Meeting (Haritos Kavallos of the Vanier Library) (10am - 11am)**

- No access to student data since the third-party blocks even the staff
- Solution is to generate mock data
- We are able to meet with other librarians

Discussed project ideas	Create a booking system where you can't book a room that's already been booked and you want to make sure it's a group of person booking a room and not just one person
	App or Website? We all agreed it is better to build a responsive website that would be compatible on devices like phones, tablets, etc. Touches multiple audiences as opposed to touching only mobile users if we decide to use an app

## **PLANNING**

- Final discussion with the professor about our prospective client
